

Scissors Lifts

Available either plain or with a roller deck:

Scissors Lifts are essential for each lay-up station. Incorporating a gravity roll conveyor on the lift deck provides easier stack movement. This arrangement is equipped with a brake to keep rollers from turning, enabling a stack of panels or doors to be assembled on a caul board placed on the conveyor. A foot control allows the operator to lower the lift as the stack is being assembled, then raise the load when needed. The entire arrangement may be recessed into a floor pit for even more convenience.

Minimum Contact Conveyors

Freewheeling sprockets support glued panels or doors as they exit the adhesive spreader and minimize disturbance to the glue line. Panels can then be handled at the operator's convenience.

Panel Feeders

Pneumatic Panel Feeders streamline the infeed process by automating the process of feeding stock, eliminating the need for an operator. Activated remotely, the panel feeder provides precise and reliable operation on demand, and its heavy-duty construction translates into a long and productive service life.

Roller Conveyors

Roller Conveyors provide ease and convenience as glued or finished product exit the spreader, coater or laminator. Freewheeling rollers allow for easy panel movement and quick maintenance. Skewed options are available for continuous operations and allow for panels to break apart automatically.

Ask for details on other optional machine accessories:

Transfer Carts • Unwind/Rewind Stands • Staging Conveyors • Paper Breakers
